54 Urea derivatives and their use as acat inhibitors.

57 Urea derivatives of formula (I)

EP 0 625 507 A2

wherein the valuable groups are as defined in the specification, which possess both an ACAT inhibitory activity and an antioxidative activity. Those derivatives are useful in the prophylaxis and treatment of hypercholesterolemia and atherosclerosis.

## FIELD OF THE INVENTION

This invention relates to new urea derivatives, processes for their preparation and their use in medicine. More particularly, the invention relates to compounds having an inhibitory activity against an acyl coenzyme A cholesterol acyltransferase (called hereafter ACAT) and having a protective ability against an oxidative modification of low density lipoprotein (called hereafter LDL).

## BACKGROUND OF THE INVENTION

In recent years, an interest has been directed to the relationship between an increase in the level of cholesterol in the serum and a human health condition. It has been pointed out that the level of cholesterol in the serum is associated with the amount of cholesterol deposited in the blood vessel system and the deposition of cholesterol in the blood vessel system brings about e.g. lesion of coronary artery, which is responsible for ischemic heart disease.

Drugs for reducing the level of cholesterol in the serum have been developed. These drugs, however, were effective in controlling blood cholesterol to an appropriate level, but ineffective in inhibiting absorption of cholesterol from the digestive tracts and deposition of cholesterol on the wall of blood vessels.

ACAT is an enzyme that catalyzes the synthesis of cholesteryl esters from acyl coenzyme A and cholesterol and plays an important role in metabolism of cholesterol and its absorption from the digestive tracts. It is believed that ACAT occurs in the site of mucosa cells of the intestinal tracts and is active in esterification and incorporation of cholesterol derived from the diet. On the other hand, the cholesterol deposited on the wall of blood vessels is the esterified cholesterol. The cholesterol accumulated in the foam cells which plays an important role in the formation of atherosclerosis lesion is also esterified cholesterol. The enzyme that catalyzes the esterification of cholesterol in these sites is also ACAT.

Accordingly, the inhibition of an ACAT activity can result in inhibiting the incorporation in vivo of cholesterol derived from the diet and further the formation of cholesteryl ester in specified cell sites.

Compounds having an ACAT inhibitory activity are disclosed in EP 0450660 A1 and EP 0477778 A2. However, those known compounds have only an ACAT inhibitory activity and give no effect on the oxidative modification of LDL causing the foam cell transformation of macrophage which is an important phenomenon for the formation of atherosclerosis lesion.

The foam cells which play an important role in the formation of atherosclerosis lesion are a product of uptake of oxidatively modified LDL into macrophage which results in the foam cell transformation of the macrophage. It is reported by Diane W. Morel et al. (Atheroma, Vol. 4, pages 357-364, 1984) that, the oxidatively modified LDL causes foam cell transformation of macrophage and plays an important role in the formation of atherosclerosis lesion. A report of TORU KITA et al. (Proc. Natl. Acad. Sci. USA, Vol. 84, pages 5928-5931, 1987) demonstrates that prevention of the oxidative modification of LDL induces regression of the atherosclerosis lesion. Therefore, inhibition of the oxidative modification of LDL, in addition to the above-mentioned ACAT inhibitory activity, is very important in preventing the formation and progression as well as inducing regression of atherosclerosis lesion.

Under such circumstances, it has been desired to develop the compound having an ACAT inhibitory activity and being capable of inhibiting an oxidative modification of LDL or the like, since such compound may decrease the serum cholesterol level and inhibit the oxidative modification of LDL cholesterol deposited on the blood vessel or tissue, thus being effective for inhibiting the formation and progression of atherosclerosis lesions and inducing its regression.

## DETAILED DESCRIPTION OF THE INVENTION

We have now found new urea derivatives which exhibit both an ACAT inhibitory activity and an antioxidative activity. The urea derivatives of the present invention possess an ACAT inhibitory activity, thereby inhibiting an absorption of cholesterol from the intestinal tracts, lowering a blood cholesterol level and inhibiting an accumulation of cholesteryl esters in the wall of blood vessels, atheroma and macrophage, and simultaneously an antioxidative activity i.e. a protective activity against the oxidative modification of LDL which participates in foam cell transformation of macrophage thereby effectively inhibiting the formation and progression of atherosclerosis lesion and inducing its regression.

According to one aspect of the present invention, there is provided a compound of formula (I) and pharmaceutically acceptable salts thereof, which exhibits both an ACAT inhibitory activity and an antioxidative activity.

### Pharmacological Test

#### 1. ACAT inhibitory activity

The enzyme preparation, ACAT was prepared from liver microsme fractions of male rabbits according to the method of E. E. Largis et al. (Journal of Lipid Research, Vol. 30, pages 681-690, 1989). The activity was calculated by assaying the amount of the labelled cholesteryl esters formed from [1-<sup>14</sup>C]oleoyl-CoA and endogenous cholesterol according to the method of Kazuichi NATORI et al. (Japan J. Pharmacol., Vol. 42, pages 517-523, 1986).

The result is shown in Table 1, in which percent inhibition of the formation of the labelled cholesteryl esters with a compound added at 10<sup>-7</sup>M is indicated as index for the ACAT inhibitory activity.

The data reveals that the compounds of the invention have a superior ACAT inhibitory activity.

#### 2. Antioxidative activity

Human LDL was incubated in the presence of cupric sulfate (5 x 10<sup>-6</sup>M) and in the presence or absence of a compound (10<sup>-6</sup>M) for 5 hrs. After the incubation, the peroxidation of low-density lipoproteins (LDL) is evaluated by the formation of malondialdehyde (MDA), which is a sort of lipid peroxides according to the method of Simon J. T. Mao et al. (J. Med. Chem., Vol. 34, pages 298-302, 1991). Activity of the compound is shown by percent inhibition of the MDA formation as compared with control. The result is shown in Table 1. The data indicates that the compounds of the invention significantly lower the formation of the lipid peroxide (MDA).

#### 3. Cholesterol-lowering activity

Sprague-Dawley male rats were given a powdery feed containing 1% cholesterol and 0.5% cholic acid in an amount of 15 g per day per animal for 3 days to produce hypercholesteremic rats. Four days later, a compound suspended in 0.5% methylcellulose was administered orally at a dose of 30 mg/kg. Blood was drawn prior to and 5 hrs after the administration of the compound, for which the plasma cholesterol level

was measured using a commercially available assay kit (Cholesterol E Test Wako, Wako Junyaku K.K.). The result is shown in Table 2.

The data shows that the compounds of the invention significantly reduce blood cholesterol level.
